Education

University of Manitoba

Bachelor of Science in Computer Engineering

Expected May 2026

4.46/4.5 GPA

Skills

Programming Languages: TypeScript, JavaScript, Python, C++, Java

Frameworks and Libraries: React, NextJS, PyTorch, OpenMPI, Node.js, Express, Flask

Tools: Git, Docker, PostgreSQL, Github Actions, Bazel, gRPC, Protocol Buffers (Protobuf), Jira, Agile

Experience

Robinhood

Software Engineer Contractor

Sep 2025 - Current

Toronto, ON

- Led a team of 3 engineers to build a tax lot selling feature, implementing observables for real-time market data updates and virtualization to ensure performant rendering for users with thousands of tax lots
- Redesigned the margin call interface with intuitive risk indicators, detailed requirement breakdowns, and actionable recovery steps to help users better understand their margin obligations and reduce overall fund recovery time

Robinhood

Software Engineer Intern

May 2025 - Sept 2025

Toronto, ON

- Owned end-to-end development and delivery of a real-time margin maintenance table built with React and TypeScript, featuring embedded trade execution and risk indicators.
- Overhauled the margin experience by expanding the server-driven UI to include futures traders and unifying business logic across Web, iOS, and Android, driving a 43% increase in visitors to the margin experience.
- Enhanced a Protobuf-based server-driven UI architecture by implementing 12 foundational components in Python and Typescript along with a logging framework to increase system usage and maintainability
- Repaired the core integration suite for the margin experience and added 20+ test suites, achieving 93% code coverage

Biosensors Research Lab

Machine Learning Research Intern

May 2024 - Dec 2024

Winnipeg, MB

- Created a custom convolutional neural network to predict cell viability from optical microscopy images, achieving 85% accuracy, establishing a non-invasive alternative to traditional staining methods for assessing cell health
- Developed a model validation GUI in Python displaying SHAP-based feature attributions, and visualizing cell images to debug model predictions
- Created a parallelized data processing pipeline with a new morphological parameter extraction algorithm, improving accuracy by 17% and cutting processing runtime by 75%.
- Replaced a high-risk system of manually-shared hard drives with a centralized MySQL database, allowing for cross-experiment queries and easy data sharing

Biosensors Research Lab

Machine Learning Research Intern

May 2023 - Aug 2023

Winnipeg, MB

- Built a framework for electronic testing equipment, allowing for automation of entire experimental sequences through Python scripts and cutting manual setup time
- Programmed an FPGA to coordinate microfluidic device operations, integrating di-electrophoresis control with synchronized LED illumination and cell imaging

Projects

Void - AI App Builder (Next.js, TypeScript, Prisma, Docker)

- Developed an app to generate and deploy web apps from user prompts, integrating a usage-based Stripe billing system to monetize user compute time and API token consumption
- Implemented a persistent background job queue to process long-running AI build tasks asynchronously, allowing users to submit jobs and receive the completed result at a later time, even after closing the browser
- Utilized Docker for user code sandboxing, secure code execution and real-time application previews
